/note="Vector: PWD42nv; Purified macronuclear chromosomal
DNA from Oxytricha trifallax was blunt end-repaired with
T4 DNA polymerase and T4 polymucleotide kinase. Adaptor
oligonucleotides were ligated to the blunt ends in high
molar excess. Vector DNA was prepared from a derivative of
pWD42 (gi|4732114|gb|AF129072.1), a copy-number inducible
derivative of plasmid R1. The vector was ligated with
adaptors complementary to the insert adaptors and
purified. The sheared, adaptored mouse DNA was annealed to
adaptored vector DNA, and transformed into
chemically-competent E. Coli XL10-Gold (Stratagene) cells
and selected for ampicillin resistance."

/note="Vector: PWD42ny: Purified macronuclear chromosomal
DNA from Oxytricha trifallax was blunt end-repaired with
T4 DNA polymerase and T4 polymucleotide kinase. Adaptor
oligomucleotides were ligated to the blunt ends in high
molar excess. Vector DNA was prepared from a derivative of
pWD42 (gi|4732114|gb|AF129072.1), a copy-number inducible
derivative of plasmid R1. The vector was ligated with
adaptors complementary to the insert adaptors and
purified. The sheared, adaptored mouse DNA was annealed to
adaptored vector DNA, and transformed into
chemically-competent E. Coli XL10-Gold (Stratagene) cells
and selected for ampicillin resistance."

Unusual features in the nucleotide sequence of a CDNA clone derived
from the common region of avian sarcoma virus messenger RNA
Proc. Natl. Acad. Sci. U.S.A. 77 (1), 176-180 (1980)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   PAT 03-JUL-2001
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ,c,s on 3,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       deleted (see separate entry).

[1] demonstrated the mRNA transcription initiation site shown in the Sites table using pSRI as a template. However, this is the 3' LITR, and the functional mRNA start site would be assumed to be on the 5' LIR at the homologous site.
                                                                                                                                                                                                                                                                                                                                     amamoto, T., Tyagi, J.S., Fagan, J.B., Jay, G., deCrombrugghe, B. and

[11] sites; mRNA start.

[12] istes; mRNA start.

[13] included 24 'g's on 5' end and 16 'c's end that were cDNA synthesis artifacts.

[2] also, sequenced a defective clone, pSR2, with the src gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Producing recombinant protein, particularly for maximizing or enhancing e.g. therapeutic protein production, by co-expressing protein with recombinant cell cycle inhibitor protein (p21) in producer cell line.

Disclosure; Page 32-33; 33pp; English.

promoter. The present sequence is used to produce vectors for use in the method of the invention. The specification describes a method for producing a protein, preferably a recombinant protein, in a mammalian anchorage-independent producer cell line. The method comprises coexpressing with the producer the producer cell line a recombinant cell cycle inhibitor protein (preferably p21). The method is useful for producing a recombinant protein in a producer cell line. This is The present sequence represents the Rous sarcoma virus (RSV)-LTR

Also described is a primate cell (I) containing and capable of expressing a transgene comprising an RSV promoter operably linked to a recombinant nucleic acid encoding one or more fusion proteins, where the fusion proteins bind to a ligand and in the presence of the ligand modulate(s) the expression of a target gene. The method can be used for high level expression of genes in primates or for engineering primate cells. It is useful for increasing the efficacy of many gene therapy strategies, and for increasing the efficacy of intracellular immunisation agents, molecules

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  like ribozymes, antisense RNA, and dominant negative proteins, that act either stoichiometrically, or by competition. The method increases the efficacy of many gene therapy strategies by substantially elevating the expression of an expression therapeutic gene, and allowing expression to reach therapeutically effective levels. The present sequence represents specifically claimed RSV enhancer/promoter nucleotide sequence from the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Rous sarcoma virus; promoter; enhancer; RSV; primate; gene expression; transgene; genetic engineering; gene therapy; immunisation; ds.

                                                                                                                                                                                             This is the nucleotide sequence of a SatI fragment of plasmid CMV-delRT, in which the immediate-early promoter of human cytomegalovirus replaces the 5' long termal repeat region of feline immunodeficiency virus (FIV) close F14-delRT (see AAVS805). FIV sequences downstream of the SatI site are identical to those in F14-delRT. Use of the CMV promoter was designed to enhance expression of FIV antigens, and to reduce the risk of reversion to a replicating provirus, in tissues after inoculation of DNA. Vaccine formulations for FIV-calated diseases include a defective feline immunodeficiency proviral (FIPV) polynucleotide comprising an in-frame
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    FIV; FIPV; vaccine; reverse transcriptase; diagnosis; therapy; CMV-delRT;

useful in producing chimeric mammals, comprises selectively destroying native cells in a tissue of a fetal non-human mammal host. Engrafting foreign replacement cells within a fetal non-human

Disclosure; SEQ ID NO 3; 48pp; English

The present invention describes a method for engrafting foreign replacement cells within a foetal non-human mammal, which comprises selectively destroying native cells in a tissue of a foetal non-human mammal host, where the number of maternal cells of the same tissue is not substantially reduced, and implanting foreign replacement cells in the tissue of the fetal non-human mammal host, where the foreign replacement cells in the cells replace destroyed cells of the tissue. The method is useful for facilitating growth and differentiation of foreign cells within a mammalian host, and for producing chimeric mammals that can be used to sequence represents a nucleotide sequence given in the Sequence Listing of the present invention but not mentioned further within the develop new drugs and vaccine, factors, drugs and tissues for transplantation, also useful to study human diseases. The present specification.

```
The present invention describes a vertebrate protein homologue of an UNC-53 protein of Caenorhabditis elegans or a functional equivalent, derivative or bioprecursor of UNC-53. Also described; (1) a CDNA sequence necoding a vertebrate homologue of the C. elegans UNC-53 protein; (2) a nucleic acid which hybridises to the CDNA of (1); (3) vector comprising the cDNA as in (1); (4) a host cell containing the vector as in (3); (5) a transgenic cell, tissue or animal comprising the vector as in (3); (6) a compound identified as an enhancer or inhibitor of the regulation of cell shape, motility or the direction of cell migration for use as a therbod for determination of whether a protein is an inhibitor or enhancer of regulation of cell behaviour, growth, shape or motility or the direction of migration by contacting a host cell expressing a homologue of UNC-53 and determining a change of phenotype; (8) a method for identification of a brotein which is

ö
active in the signal transduction pathway of a cell of which a vertebrate homologue of UNC-53 is a component comprising: (i) contacting an extract of a cell with an antibody to the UNC-53 homologue; (ii) identifying an antibody/homologue complex, and (iii) analysing such a complex to identify any non-antibody protein bound to the complex. UNC-53 is a signal transducting or signal integrator protein involved in controlling directionality of cell migration and cell shape in C. elegans. Vertebrate homologues of UNC-53 can be used to promote neuronal regeneration, revascularisation or wound healing, to treat chronic neurodegenerative diseases or acute traumatic injuries or fibrotic diseases. The present sequence is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           81 CTGCTCCCTGCTTGTGTTGTGTGGCTCGCTGAGTGCGCGGAGGAAATTTAAGCTACA 140

The present invention describes a method for engrafting foreign replacement cells within a foetal non-human mammal, which comprises selectively destroying native cells in a tissue of a foetal non-human mammal host, where the number of maternal cells of the same tissue is not substantially reduced, and implanting foreign replacement cells in the tissue of the fetal non-human mammal host, where the foreign replacement cells replace destroyed cells of the tissue. The method is useful for facilitating growth and differentiation of foreign cells within a mammalian host, and for producing chimeric mammals that can be used to develop new drugs and vaccine, factors, drugs and tissues for transplantation, also useful to study human diseases. The present sequence represents a nucleotide sequence given in the Sequence Listing of the present invention but not mentioned further within the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 2241 BP; 498 A; 630 C; 609 G; 504 T; 0 U; 0 Other;

The present sequence is used to produce vectors for use in the method of the invention. The specification describes a method for producing a protein, preferably a recombinant protein, in a mammalian anchorage-independent producer cell line. The method comprises co-expressing with the protein in the producer cell line a recombinant cell cycle inhibitor protein (preferably p21). The method is useful for producing a recombinant protein in a producer cell line. This is useful for producing a recombinant protein in a producer cell line. This is particularly useful for maximizing or enhancing the production of e.g. therapeutic proteins at an industrial scale

The present invention describes a method for engrafting foreign replacement cells within a foetal non-human mammal, which comprises selectively destroying native cells in a tissue of a foetal non-human mammal host, where the number of maternal cells of the same tissue is not substantially reduced, and implanting foreign replacement cells in the tissue of the fetal non-human mammal host, where the foreign replacement cells in the cells replace destroyed cells of the tissue. The method is useful for facilitating growth and differentiation of foreign cells within a mammalian host, and for producing chimeric mammals that can be used to develop new drugs and vaccine, factors, drugs and tissues for transplantation, also useful to study human diseases. The present sequence represents a nucleotide sequence given in the Sequence Listing of the present invention but not mentioned further within the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to a gene directed enzyme prodrug therapy (GDEPT) using post translational glycosylphosphatidylinositol (GPI) addition to a prodrug activating enzyme which enables anchorage of the enzyme at the call surface. Carboxypeptidaes G2 (CPG3) is a preferred prodrug activating enzyme. The invention also relates to an expression vector for expression of a GPI enzyme hybrid capable of anchorage to the surface of a mammalian cell. The expression vector comprise polynucleotide sequences encoding a signal peptide, an enzyme capable of activating a prodrug, and a post-translational GPI addition motif. The expression vector is useful in the manufacture of a medicament for cancer therapy in a mammalian host. The present DNA sequence is a plasmid pug3/RC/CGO2-THY1 comprising CPG2 nucleic acid sequence with the last excon of rat Thy 1 gene at its 3' end. (Updated on 11-SEP-2003 to

The present invention relates to a gene directed enzyme prodrug therapy (GDEPT) using post translational glycosylphosphatidylinositol (GPI) addition to a prodrug activating enzyme which enables anchorage of the enzyme at the cell surface. Carboxypeptidase G2 (CPG2) is a preferred prodrug activating enzyme. The invention also relates to an expression vector for expression of a GPI enzyme hybrid capable of anchorage to the surface of a mammalian cell. The expression vector comprise polymucleotide sequences encoding a signal peptide, an enzyme capable of activating a prodrug, and a post-translational GPI addition motif. The expression vector is useful in the manufacture of a medicament for cancer therapy in a mammalian host. The present DNA sequence is a plasmid bNG3/RC/CPG2 (G3) comprising CPG2 variant CPG2 (G3) and the last exon of rat Thy-1 at the 3' end. (Updated on 11-5EP-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              CTGCTCCCTGCTTGTGTTTGGAGTCGCTGAGTAGTGCGCGAGCAAATTTAAGCTACA 129

The chimeric antibody (AAW14940) is specific for porcine vascular cell adhesion molecule (VCAM) and is useful for diagnosing human rejection of porcine xenotransplants and for improving xenotransplantation of porcine cilsusues and organs into human recipients. (Updated on 17-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Matis LA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Antibodies binding to porcine but not human cell interaction proteins useful to treat and assay for rejection of xenografted porcine organs,

This is the nucleotide sequence of pCTM, a plasmid which contains a CMV promoter, a tripartite adenovirus leader flanked by T7 and SP6 promoters, and a multiple cloning site with a bovine growth hormone polyA site and downstream SV40 polyA site. It has been used as a vector for the expression of fusion proteins of the invention that comprise retinoblastoma protein (BP, see AAW62465) and ESF transcription factor (see AAW62464). Such fusion proteins, particularly expressed from gene therapy vectors, are used to treat hyperproliferative conditions, specifically cancer (particularly of the bladder) or restenosis. They are more effective in repressing transcription of the ESF promoter than RB alone and cause cell-cycle arrest in a variety of cells. (Updated on 27-AUG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      CTGCTCCCTGCTTGTGTTGGAGGTCGCTGAGTAGTGCGCGAGAAAATTTAAAGCTACA 140

                                                   A DNA sequence (AAT62931) comprises a 2A2 human G2/G4 (see also AAT62931) chimeric antibody expression plasmid insert sequence. The chimeric antibody (AAM14934) is specific for porcine vascular cell adhesion molecule (VCAM) and is useful for diagnosing human rejection of porcine xenotransplants and for improving xenotransplants and for improving xenotransplantation of porcine tissues and organs into human recipients. (Updated on 17-OCT-2003 to standardise OS field)

Selectable retroviral packaging cell lines and expression constructs - comprise selectable gene downstream of gene of interest, are selectable due to the in-efficiency associated with translation re-initiation.

Claim 23; Fig 13; 79pp; English

This sequence represents the recombinant expression plasmid CWV10A. This sequence is a packaging-deficient construct having a viral env gene (in this cases from moloney marine leukaemia virus under how promoter control) and a selectable marker (SM). It is an example of a recombinant expression vector (REV) of the invention, used to create a packaging cell line. The REVS of the invention comprise a gene of interest (GOI) and a SM gene. The SM gene is arranged downstream of the GOI and a GOI associated stop codon is spaced from a start codon of the SM gene to ensure that the SM protein is expressed as a result of translation. The cell lines are transformed with two REVS, both are replication deficient, one contains the viral gag-pol gene, the other the CM rial env gene. By using helper constructs, such as the REV's, which are directly selectable and which provide for high expression of the viral gene, high titre retroviral vectors may be obtained. The packaging cell lines are useful for gene therspy. Prior packaging cell inces are useful for gene therspy. Prior packaging cell lines are useful for gene therspy. Prior packaging cell lines are useful for gene therspy. Prior packaging cell lines are useful for high expression of the viral lines using full lines are useful for packaging cell lines are useful for high expression of the viral lines using full lines are useful lines using full length retroviral genomes as helper genomes were isolated by cotransfecting them with plasmids encoding selectable markers. However, the helper functions can be lost during the passages of the cells in culture and the current packaging systems provide limited titres of infectious retroviral vectors. Co-transfection with a plasmid encoding a SM does not directly select the best gag-pol-env-expressing cells. The new retroviral packaging cell lines overcome these problems

                  The randomly sheared gDNA was chromatographed on Sephacryl S-400 to remove any small fragments and DNA eluting in the void volume was blunt-ended with T4 DNA Polymerase, treated with alkaline phosphatase to prevent the ligation of multiple fragments, ligated to Srf I-digested pCR-Script Amp (SK+) vector and transformed into E. coll strain XLIO Gold. Recombinant clones from the first plating of the library were selected for sequence analysis using T3 and T7 primers."

This is a long-transcript enriched cDNA library (Genome Res. 11: 1553-1558 (2001). [PMID: 11541991) from WAO1 cell line. Undifferentiated human ES cell line WAO1 cell line. Undifferentiated human ES cell line WAO1/H1 was obtained from WiCell Research Institute, Inc., Wadison, Wi. cultured according to their instructions, on MEF feeders. They formed acondines with defined edges and were positive for alkaline phosphatase, SSEA-4, OCT3, OCT4, REX1, UTF, TERT, SOX2, CX43 and CX45. FPF3, SSEA-1, TUBB3, MES, GRAPA, POXI, NCAM, MSX1, FF13, SSEA-1, TUBB3, MES, GRAPA, EDXI, NCAM, MSX1, FF13, SSEA-1, TUBB3, MES, GRAPA, ES cells from 4 X 6cm dishes were treated with 1 mg/ml collagenase, type IV (Invitrogen/GIBCO) for 5-10 min and gently scraped off with 5 ml pipette. RNA was purified with TRIZO1 Reagent from Invitrogen. Protocol ref: Genome Res. 11: 1553-1558 (2001). [PMID:11544199]) Double-stranded cDNAs were synthesized with an Oligo(dT) primer [Invitrogen: 1.1.1573-158] (2001). [PMID:11544199]) primer [Invitrogen: 1.1.1573-158] (2001).

The cDNAs were ligated to Lone-linker LL-Sal4, purified by phenol/chloroform extraction, and separated from free linkers by Centricon-100 column. Then, the cDNAs were amplified by long-range high fidelity FCR using Ex Taq polymerase

(Takara) with a primer Sal4-S for 25 cycles. The products were purified by phenol/chloroform extraction and Centricon-100 column. The cDNAs were digested with SalI and NotI enzymes and cloned into SalI/NotI site of pCMV-SPORT6 plasmid vector. The average insert size is about 3.6kb.

/note="Vector: pUCIB: Site 1: Smal; Constructed at The Institute for Genomic Research (TIGR), Rockville, MD. Genomic DNA isolated from a cloned population of Trypanosoma bruce: (TREU927/4 GUTat 10:1) was mechanically sheared to give a tight size distribution (approx 2 kb). The v + i method used for the library construction is described in detail in Smith, H.O. and Venter, J.C. (Making small insert libraries for whole genome shotgun sequencing projects. In Genome Sequencing: A Practical Approach, eds. M. Vaudin and B. Barell, Oxford University Press, 1999)."

Clones are derived from the Trypanosoma brucei GUTat 10.1 sheared

DNA library constructed at TIGR. Clones will be available for
distribution through ATCC. Sheared DNA end sequences search page:
ttp://www.tigr.org/tdb/mdb/tbdb/.
Seq primer: M13-Reverse
Class: shotgun.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           each of which contains one or more TDNA insertion elements. The resultant fragment for each line was directly sequenced to determine the genomic sequence at the site of insertion. Details of the protocols used can be found at http://signal.salk.edu/tdna_protocols.html"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Eukaryota, Viridiplantae, Streptophyta, Embryophyta, Tracheophyta,

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

New nucleic acids and polypeptides, useful for diagnosing, preventing or treating medical conditions.

Disclosure; SEQ ID NO 674; 753pp; English

The invention relates to novel isolated nucleic acid molecules (I)

cncoding human secreted proteins (II). (I) and (II) are used to prevent,

treat or ameliorate a medical condition in e.g. humans, mice, rabbits,

goats, horses, cats, dogs, chickens or sheep. (I) and (II) may be used in

the prevention, treatment and diagnosis of diseases associated with

inappropriate expression of secreted proteins. (I) and complementary

sequences may also be used as DNA probes in diagnostic assays (e.g.

polymerase chain reactions (PCR) to detect and quantitate the presence

of similar nucleic acid sequences in samples, and so which patients may

be production of antibodies and in assays to identify modulators

(agonists and antagonists) of the expression and activity of the secreted

can regulate expression and activity of (II) antibodies

may also be used as diagnostic agents for detecting the presence of (II)

The invention relates to novel isolated nucleic acid molecules (I)

cncoding human secreted proteins (II). (I) and (II) are used to prevent,

treat or ameliarate a medicial condition in e.g. humans, mice, rabbits,

gaats, horses, cats, dogs, chickens or sheep. (I) and (II) may be used in

the prevention, treatment and diagnosis of diseases associated with

the prevention, treatment and diagnosis of diseases associated with

the prevention, treatment and diagnosis of diseases associated with

the prevention, treatment and diagnosis of diseases associated with

sequences may also be used as DNA probes in diagnostic assays (e.g.

polymerase chain reactions (PCR)) to detect and quantitate the presence

of similar nucleic acid sequences in samples, and so which patients may

be in need of restorative therapy. (II) may also be used as antigens in

the production of antibodies and in assays to identify modulators

consists and antegonists of the expression and activity of the secreted

proteins. The anti-(II) antibodies and antagonists may also be used to

down regulate expression and activity of (II). The anti-(II) antibodies

consy also be used as diagnostic agents for detecting the presence of (II)

in samples (e.g. by enzyme linked immunosorbant assay (ELISA)). The

disorders include for example: Immune/autoimmune diseases (e.g. HIV

(human immunodeficiency virus) infections, anaemia, rheumatoid arthritis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New nucleic acids and polypeptides, useful for diagnosing, preventing or treating medical conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Disclosure; SEQ ID NO 675; 753pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Ruben SM;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     AAK54951 to AAK64702 encode the human immune/haematopoietic antigen (I)

amino acid sequences given in AAM82170 to AAM91921. (I) have cytostatic

activity, and can be used in gene therapy and vaccine production. (I)

proteins and polynucleotides may be used in the prevention, diagnosis and

treatment of diseases associated with inappropriate (I) expression. For

example, they may be used to treat disorders associated with decreased

expression by rectifying mutations or deletions in a patient's genome

that affect the activity of (I) by expressing inactive proteins or to

supplement the patients own production of (I). Additionally, (I)

cubylucleotides may be used to produce the secreted (I), by inserting the

nucleic acids into a host cell and culturing the cell to express the

protein. (I) proteins and polynucleotides may be used to prevent,

cancers and cancer metastases of haematopoietic-derived cells. AAK64703

cancers and cancer metastases of haematopoietic-derived cells. AAK64703

to AAK87694 represent human immune/haematopoietic antigen genomic

sequences from the present invention. AAK64942 to AAK64950 and AAM82169

represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Nucleic acids encoding human immune/hematopoietic antigen polypeptides, useful for preventing, diagnosing and/or treating cancers and metastasis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    92

                                                                                          Isolated nucleic acid molecule encoding a reproductive system antigen is used in preventing, treating or ameliorating a medical condition.
                                                                                                                                                                                                                                                                                                                                92
                                                                                                                                                         The present invention provides the protein and coding sequences of a number of human reproductive system related antigens. These can be used in the prevention and treatment of reproductive system disorders, including cancer. The present sequence is a genomic sequence encoding a protein of the invention

ABZ73281-ABZ73697 represent cDNAs corresponding to 391 human secreted protein genes, and ABP00947-ABP01363 represent the proteins they encode. ABZ73689-ABZ74687 represent human secreted protein genomic fragments. The invention also encompasses antibodies specific for the secreted proteins, the use of the secreted proteins in drug screening and recombinant. The secreted proteins in drug screening and recombinant. The secreted proteins are thought to be involved in biological activities associated with cellular signalling, cellular differentiation, cell migration, prohormone activation and neurotransmitter activity. The secreted proteins, and modulators of protein fragments specific for the secreted proteins, and modulators of protein cargments specific for the secreted proteins, and modulators of protein fragments specific for the secreted proteins, and modulators of protein cations are useful for diagnosing or treating cancers or other heir nucleic acids may also be used in the treatment of autoimmune disorders, inflammatory disorders, diseases involving angiogenesis, ADDS (acquired immunodeficiency syndroms), hepatitis, anaemia, and to promote wound healing. Nucleic acids of the invention may be used for chromosome identification, chromosome mapping, in gene therapy, for identifying an molecular weight markers. The present sequence represents a human secreted protein genomic fragment referred to in the disclosure of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      or

ABZ73281-ABZ73697 represent cDNAs corresponding to 391 human secreted protein genes, and ABP00947-ABP01363 represent the proteins they encode. ABZ73689-ABZ74687 represent human secreted protein genomic fragments. The invention also encompasses antibodies specific for the secreted proteins, the use of the secreted proteins in drug screening and recombinant. The secreted proteins in drug screening and recombinant. The secreted proteins are thought to be involved in biological activities associated with cellular signalling, cellular differentiation, cell migration, prothormone activation and neurotransmitter activity. The escreted proteins, nucleic acids encoding them, antibodies or antibody fragments specific for the secreted proteins, and modulators of protein crypty are useful for diagnosing or treating cancers or other hyperproliferative disorders. Additionally, the secreted proteins and their nucleic acids may also be used in the treatment of autoimmune disorders, inflammatory disorders, diseases involving angiogenesis, ADS (acquired immunodeficiency syndrome), hepatitis, anaemia, and to promote wound healing. Nucleic acids of the invention may be used for chromosome identification, chromosome mapping, in gene therapy, for identifying individuals from minute biological seamples, as hybridisation probes, and as molecular weight markers. The present sequence represents a human secreted protein genomic fragment referred to in the disclosure of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New human secreted proteins and nucleic acids, useful for detecting or treating cancer or other hyperproliferative disorders, autoimmune disorders, inflammatory disorders, HIV disease, hepatitis or anemia.
                                                                                                                                                                                                                                                                                                                                                             autoimmune disorder; inflammation; angiogenic diseases; AIDS; acquired immunodeficiency syndrome; hepatitis; anaemia; wound healing; drug screening; chromosome identification; chromosome mapping; cytostatic; gene therapy; antiinflammatory; immunomodulator; anti-HIV;
                                                                                                                                                                                                                                                                                                                                          Human; secreted protein; cancer; tumour; hyperproliferative disorder;
